2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a ". " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
// You are using Java
import java.util.*;

class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine();
        try {
            if (email.startsWith(".") || email.endsWith("."))
                throw new DotException("DotException: Invalid Dot usage");
            if (email.startsWith("@") || email.endsWith("@"))
                throw new AtTheRateException("AtTheRateException: Invalid @
usage");
            if (email.contains("..") || email.contains("@@"))
```

```
        throw new AtTheRateException("AtTheRateException: Invalid @  
usage");  
  
        int atCount = email.length() - email.replace("@", "").length();  
        if (atCount != 1)  
            throw new AtTheRateException("AtTheRateException: Invalid @  
usage");  
  
        int atIndex = email.indexOf("@");  
        String afterAt = email.substring(atIndex + 1);  
        int dotCount = afterAt.length() - afterAt.replace(".", "").length();  
        if (dotCount != 1)  
            throw new DotException("DotException: Invalid Dot usage");  
  
        int lastDotIndex = email.lastIndexOf(".");  
        String domain = email.substring(lastDotIndex + 1);  
        if (!domain.equals("in") && !domain.equals("com") && !  
domain.equals("net") && !domain.equals("biz"))  
            throw new DomainException("DomainException: Invalid Domain");  
  
        System.out.println("Valid email address");  
    } catch (DotException | AtTheRateException | DomainException e) {  
        System.out.println(e.getMessage());  
        System.out.println("Invalid email address");  
    }  
}
```
